

MemChannel™ 10 mL and HT-96*

MD1-110/MD1-111

MemChannel™* is rational sparse-matrix screen based on a hand-curated database of ion channel protein crystallization conditions data-mined from the Protein Data Bank.

MD1-110 is presented as 96 x 10 mL conditions./MD-111 is presented as 96 x 1 mL conditions.

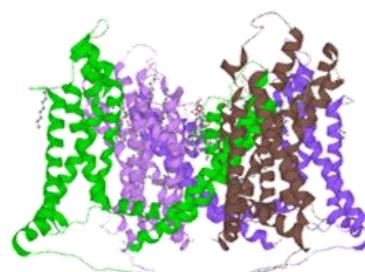

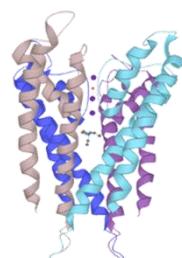

The best screen for your ion channel:

- MemChannel includes the crystallisation conditions most commonly associated with ion channel proteins.
- Data-mined from approximately 150 ion channel structures found in the pdb.
- Hand-curated database³ to remove false positives and ensure only ion channel crystallisation conditions contributed to screen development.
- From the laboratory of MemGold™ developer, Prof. Simon Newstead.

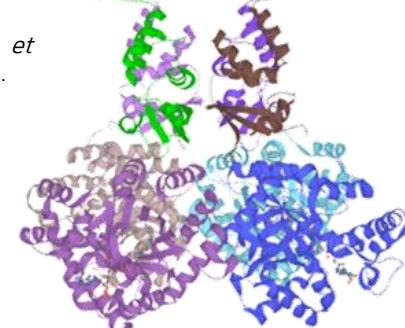

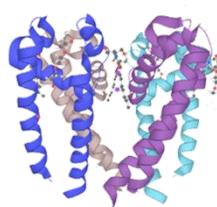

target important groups of α -helical membrane proteins.

MemChannel contains the most commonly occurring conditions for crystallising ion channel proteins found in the protein database, thus maximising your chance of crystallising a member of this large and therapeutically important group of membrane proteins.

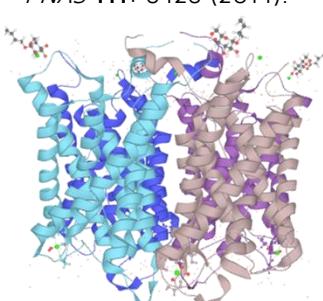

Examples of structures solved from crystals grown in conditions similar to those in MemChannel include:

1JVM: KcsA Potassium channel. Morais-Cabral, JH et al. *Nature* **414**: 37 (2001).

4P3O: Voltage-gated Sodium channel. Bagnérat, C et al. *PNAS* **111**: 8428 (2014).

(Above) 5WIE: Voltage-gated potassium channel. Pau, V. et al. *NSMB* **24**: 857 (2017).

(Left) 5BN2: Aquaporin. Fischer, G. et al. To be published.

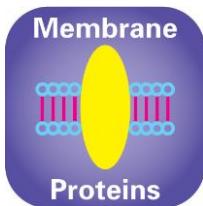

Introduction

Our popular MemGold™ (1) and MemGold™ II (1,2) screens have enabled the crystallization of many membrane protein structures. The developer of those screens, Prof. Simon Newstead of Oxford University, has continued to maintain his hand-curated database (3) of α -helical membrane protein structures and their crystallization conditions.

Today, the dataset (3) is sufficiently large that it is possible not just to identify the most common crystallisation conditions for membrane proteins in general, but also to analyse the differences in growth conditions between functionally-related sub-groups in a statistically robust manner. This has resulted in the development of a new generation of screens from Prof. Newstead that

Molecular Dimensions

Formulation Notes:

MemChannel™ reagents are formulated using ultrapure water (>18.0 MΩ) and are sterile-filtered using 0.22 µm filters. No preservatives are added.

Final pH may vary from that specified on the datasheet. Molecular Dimensions will be happy to discuss the precise formulation of individual reagents.

Individual reagents and stock solutions for optimization are available from Molecular Dimensions.

Enquiries regarding MemChannel™ formulation, interpretation of results or optimization strategies are welcome. Please e-mail, fax or phone your query to Molecular Dimensions.

Contact and product details can be found at www.moleculardimensions.com.
